

## API documentation for HTML to PDF conversion

### **Uploading an HTML File:**

POST /htmltopdf?filename=<filename.html>

Header: Content-type: text/html (Optional)

Body: < The content of the file >

Response: receive an "Integer" as the "file id" of the upload.

This "file id" will be used to query status of the file as well as for downloading the pdf version later

### **Check for the status of the file:**

/statusbyid?id=<your file id>

Response: "File not found", "Uploaded", "Complete", "Downloaded".  
"Unknown Status", "DB Error:"

### **Download the PDF:**

/downloadbyid?id=<your file id>

Response:

Content-type: 'application/pdf'

Body: <converted pdf file>

Tips for front end development:

1. <https://html2pdf.com/>

Look at the drag and drop pane of this and drag a couple of files into that. See how it is done. Use that. Good new interface style to learn.
